

Ouro Finance

Money moves. The record doesn't.

THE BANK TEXTS YOU

The debit notice arrives as a Telegram message. The app never sees it, so the expense has to be typed in by hand — and by evening nobody remembers what the 43 000 was for.

THE BILL SPLITS FOUR WAYS

One person pays for everyone, the rest work out their shares in a notes app or in their head. Nobody goes through the line items — it gets divided “roughly evenly”.

THE DEBT LIVES IN A CHAT

“I owe you for the taxi.” “You owe me for groceries.” Nobody nets the two, and a month later it is easier to forget than to bring it up.

A week later nobody remembers what they spent, or who owes whom.

The app knows the expense — and knows who owes whom

One event — dinner for four — normally falls apart into four: an expense, a receipt, an argument about shares, and four debts. Here it stays one event from beginning to end.

The receipt becomes shares, the shares become debts, and the debts collapse into a single figure per person. Nobody does the arithmetic.

Photograph the receipt — the items sort themselves out

Recognition pulls the lines, quantities, prices, VAT and service charge out of the photo. From there nobody types — they only correct whatever came out wrong.

- Up to three frames of one long receipt merge into a single list
- HEIC straight from an iPhone is accepted as is, no conversion
- No receipt at all — items can be entered by hand, same steps
- The draft saves itself: close the app and come back to it

On screen — a real receipt from the live demo: dinner at Chorsu Grill for 426 000 UZS. Screens are shown with the English interface, which is in localization now.

Items fly out to the people

Evenly across everyone, item by item, or by splitting a single line between two. People come from contacts in one tap, and the “same as last time” preset repeats the arrangement from the previous dinner.

- An “assigned 6 of 6” indicator refuses to save a half-split receipt
- A friend paid — instead of your expense you get your debt to them for your share
- The expense and its debts stay tied together: edit the total and the shares follow
- The finished receipt sends as a link — Telegram unfurls it as a card

Not a stack of IOUs, one figure per person

Every debt with one person collapses into a net: opposing amounts cancel out, leaving a sum and a direction. The screen answers the only question people actually ask — **who owes whom, and how much.**

● THEY OWE YOU ● YOU OWE THEM

- Settle with a single payment: it closes that person’s debts oldest first
- Partial payment, overpayment and forgiving the remainder each leave their own trace
- The transfer fee books as a separate expense and never distorts the debt
- Due date and privacy are set per debt

Forward the bank’s message — the expense is already in the app

The only thing a person does is forward the message to a bot. Everything after that is parsing: the amount, the account, the category and the duplicates are the server’s job.

AS IT STANDS TODAY One bank is parsed: HUMO (UZS). Parsers sit in their own layer, so adding a bank does not touch the rest of the app.

You can see where the money goes

One page instead of tabs: income, expenses, balance and average spend at the top, then the category donut, spending pace with a forecast to the end of the period, and a comparison with the last one.

- A separate “unreturned debts” segment — money that left but was not spent
- The financial month starts where you want: paid on the 10th, month starts on the 10th
- Swipe between periods, filter by account, day / month / year
- Everything converts to the home currency — accounts can be in six

And how much there is to spend today

The home screen answers the question people put to themselves every day. Not “how much did I spend last month”, but “how much can I spend right now”.

SPEND / DAY	SAFE	LEFT
567 200	1 463 000	12 days

Figures taken from the screen on the right: the safe daily allowance is the money available divided by the days left in the month, with a status color.

- A new expense — amount and category, both predicted from history
- History is grouped by day, with a total for each day
- Works offline: cached data appears instantly

Trackers count your money. Splitters count everyone else's.

Which leaves people running both and reconciling by hand. Here an expense and a debt are one record, not two in different places.

	EXPENSE TRACKERS Money Lover, Zenmoney	SPLITTERS Splitwise	OURO FINANCE
Personal expenses, categories, budget	YES	NO	YES
Receipt items become people's shares	NO	NO	YES
Debts net down to one figure per person	NO	YES	YES
Expense and debt are one event, not two	NO	NO	YES
Entry from local bank notifications	NO	NO	YES

What already works

The product is in production and ships weekly. We are not showing metrics — the users arrived without any marketing, and any number right now would say more about us than about the market.

IN PRODUCTION

- Receipt scanning with item recognition
- Bill splitting and net debts
- HUMO notification import via Telegram
- Telegram Mini App for confirmation
- Analytics, budget, daily allowance
- Six currencies inside one account
- Recurring payments with reminders
- Offline PWA, desktop version

IN PROGRESS

- Other banks in Uzbekistan
- English interface
- iOS and Android apps
- Desktop for the remaining pages
- Premium features behind a subscription

One and the same app: phone, desktop and Telegram Mini App.

Monetization — subscription

Payment acceptance is already wired up and working. Turning the subscription on is the next step.
